

C-6.8

One way to do this is the following: in the `external()` function, set `height` and `balance` to be zero. Then, alter the `right()` function as follows:

Algorithm `right()`:

```
if isInternal(v) then
  if v.left.height > v.right.height then
    v.height = v.left.height + 1;
  else
    v.height = v.right.height + 1;
  v.balance = absval(v.right.height - v.left.height);
printBalanceFactor(v)
```
