R-9.16

The worst-case height of an AVL tree or red-black tree with 100,000 items is $2 \log 100,000$. A $(2,4)$ tree storing these same number of items would have a worst-case height of $\log 100,000$. A binary search tree storing such a set would have a worst-case height of 100,000.
